RECOMMENDATIONS

CONTEXT

This document supports the final project presentation. Using 2,176 purchases from a Kaggle fashion boutique dataset, the analysis found that **no single product characteristic strongly drives returns**: size and price range showed no association, and collection was only borderline (p = 0.049). The most common return reasons are changed mind, size and quality. The actions below are hypotheses to test, not proven fixes.

2,176	320	14.7%
purchases	returned items	overall return rate

RECOMMENDATION 1

Improve size charts and product information

WHY

"Size Issue" (18.8%) and "Color Mismatch" (14.4%) together account for about one in three returns. Summer has the highest return rate (17.4%).

ACTION

Add real measurements, fit notes and fabric details to each product page. Start with Summer pieces.

TRACK: Share of size and color returns | Return rate by collection

RECOMMENDATION 2

Reward conscious purchases in loyalty programs

WHY

"Changed Mind" is the top return reason (21.3%), which points to impulse buying.

ACTION

Keep member benefits, but make clear that returns reduce the points balance. Pilot with a small group first.

TRACK: Return rate | Repeat purchases | Customer satisfaction (pilot vs. control)

RECOMMENDATION 3

Limit free assisted returns

WHY

Returns carry logistics costs and emissions (not measured in this dataset).

ACTION

Offer free carrier pick-up only above a minimum order value or to premium customers.

TRACK: Cost per return | Share of assisted returns | Conversion rate
